HOW EVERY MODULE WORKS

- 1 **Read the objective & the formula** — what you're learning and the math behind it.
- 2 **Apply it — your choice** — compute it yourself, estimate then reveal, or show the answer.
- 3 **Write the Excel formula** — the app runs it on the grid and checks your answer.
- 4 **Read the feedback** — is your answer reasonable, and what's even better?
- 5 **Answer the guiding question & try again** — then a green ✓ points you to the next tab.

 **Running Juicetification:** pick your forecast → **calculate** the staffing & prep plan yourself → set the sliders and **open for the day**. You'll see the profit, customer satisfaction, and where over- or under-forecasting cost you money.

 **In Excel, always use cell references.** Point to the cells (`=AVERAGE(D5:F5)`), never type the numbers (`= (280+300+315)/3` is rejected). That's the skill employers want.

YOUR THREE SCORES

/100
COMPLETENESS
effort — how much
you finished

/100
MASTERY
skill — right on the
first try

/100
PERFORMANCE
application — how
well you ran the
bar

WATCH YOUR PROGRESS

The sidebar shows a live progress bar and your mastery so far. Your answers save automatically — you can go back and edit any tab before you submit.

WHAT TO SUBMIT

- Add your **name / student ID** in the sidebar.
- Finish all sections (aim for **Completeness 100**).
- On **Final Report**, download the **Submission PDF**.
- Upload the PDF to your LMS. ✓

 **The debrief matters most.** It shows your biggest forecast miss and what it cost — then asks for one rule you'll keep. That rule is the real takeaway.

 **Your data is unique.** Everyone gets a different Session ID and scenario, so compare methods — not answers.

 **Stuck on a number?** Pick "Estimate, then reveal" to see the worked solution, then try the Excel version yourself.

 **Remember the trade-off.** Under-forecasting loses sales & goodwill; over-forecasting spoils fruit. They don't cost the same.
